Hard_EnglishPassage_3023
Agricultural Reforms and Rural Economy

Words: 537, Characters: 4347 **LEVEL: HARD**

The agricultural sector, historically regarded as the primary backbone of the Indian 84
economy, is currently standing at a critical crossroads, urgently requiring 160
comprehensive, structural reforms to ensure long-term sustainability and global 240
competitiveness. Since the monumental success of the "Green Revolution" in the 319
mid-1960s, the nation successfully transformed itself from a severely food-deficient 404
country, heavily dependent on foreign grain shipments, into a globally recognized, net 491
exporter of major agricultural commodities like rice, wheat, and spices. This historic 578
agricultural transformation was primarily driven by the rapid adoption of 652
high-yielding variety (HYV) seeds, massive government investments in irrigation 732
infrastructure, and the heavy, subsidized application of chemical fertilizers. However, 820
this intensive, input-heavy model of farming has gradually reached its ecological and 906
economic limits, leading to severe, unintended consequences such as the rapid 984
depletion of underground water tables, widespread soil degradation, and alarming 1065
levels of environmental pollution. Today, the rural economy faces a highly complex set 1152
of modern challenges, predominantly characterized by highly fragmented, 1224
uneconomical landholdings, unpredictable weather patterns exacerbated by global 1304
climate change, and incredibly low profit margins for the average, small-scale farmer. 1391
To directly address the severe inefficiencies plaguing the traditional agricultural 1475
marketing system, the central government officially launched the National Agriculture 1561
Market, widely known as "e-NAM", on April 14, 2016. This highly innovative, 1637
pan-India electronic trading portal aims to completely network the existing physical 1722
wholesale markets (mandis), thereby creating a unified, seamless national market for 1807
agricultural commodities. By facilitating transparent, online price discovery and 1889
removing the exploitative grip of local, politically-connected middlemen, e-NAM 1969
empowers farmers to secure better, highly competitive prices for their hard-earned 2052
produce. Furthermore, the controversial debate surrounding the Minimum Support 2131
Price (MSP) system continues to dominate the national socio-political discourse. While 2218
the MSP acts as a crucial, financial safety-net for millions of vulnerable farmers, 2302
preventing distress sales during periods of bumper harvests, economists argue that 2385
an over-reliance on government procurement heavily distorts cropping patterns. For 2468
instance, the guaranteed procurement of water-guzzling crops like paddy and 2544
sugarcane in semi-arid, rain-fed regions has completely devastated the local 2621
ecological balance. Consequently, policymakers are actively promoting agricultural 2704
diversification, encouraging farmers to shift towards the cultivation of high-value, 2789

climate-resilient horticulture crops, pulses, and oilseeds. In addition to marketing 2874
reforms, the integration of cutting-edge, precision-farming technology is absolutely 2959
indispensable for revitalizing the stagnant rural economy. The deployment of 3036
agricultural drones for targeted pesticide spraying, the utilization of satellite imagery 3126
for highly accurate crop-yield estimations, and the application of internet-of-things 3212
(IoT) sensors for automated, micro-drip irrigation can drastically reduce production 3297
costs while maximizing overall productivity. Moreover, the rapid promotion of Farmer 3382
Producer Organizations (FPOs) represents a highly strategic, community-driven 3460
approach to solving the problem of fragmented landholdings. By legally organizing 3542
small and marginal farmers into robust, business-oriented collectives, FPOs enable 3625
them to leverage economies of scale, collectively purchase expensive agricultural 3707
machinery, and negotiate highly lucrative contracts directly with large, multinational 3794
food-processing corporations. Ultimately, securing the future of Indian agriculture 3878
demands a holistic, scientifically-driven approach that prioritizes ecological 3957
sustainability just as much as economic profitability. By substantially increasing 4040
public investments in rural infrastructure, expanding cold-chain storage facilities, and 4129
fostering a vibrant, agri-tech startup ecosystem, the nation can successfully transform 4217
its traditional farming practices into a highly dynamic, globally competitive, and 4300
incredibly prosperous agricultural enterprise. 4347
